

The flow recession that started since the beginning of October 2020 continues in most of the Niger basin, with increasingly marked low water levels in Upper and Lower Niger. On the other hand, the Guinean flood continues to rise in November in the Inner Delta and Middle Niger.

The reservoirs of Sélingué in Mali and Kainji in Nigeria have reached the normal filling level. The data used for the various analyses below came from hydrological observation networks of the National Hydrological Services and Dam Authorities of nine (9) member countries. The flow analysis situation was carried out by dividing the basin into four (4) subcatchments also represented with reference gauging stations as follows: Upper Niger at Koulikoro (Mali), Inland Delta at Dire (Mali), Middle Niger in Niamey (Niger) and Lower Niger at Lokoja (Nigeria)
